

Fork Positioner for Forklifts

Fork Positioner for Forklifts - A fork positioner is a device constructed out of high quality materials intended to be able to withstand the most challenging procedures and work environments. This piece of equipment could enable the person driving to maneuver the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate more precise lifting and placement in a faster and more efficient manner.

The fork pocket is rather unique and could enable the operator to be able to safely swing the blades into position without any worry of destroying the positioning cylinders. This can allow the driver the alternative to execute simultaneous or independent fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages can be converted into blade positioners on existing units.
